基础路径: <a href="http://localhost:80/api/v1">http://localhost:80/api/v1</a>

### 买入

POST /stock/buy 请求体

```
"code": "002188",
    "price": "1.22",
    "volume": 100,
    "acceptRisk": false
}
```

字段	类型	必填	描述
code	string	是	股票代码,必须是 6位数字的字符串,如: "002188"
price	float	是	价格,最多支持3位小数,如: 1.22
volume	int	是	数量,必须是100倍数,如: 1200
acceptRisk	boolean	否	是否接受风险,如果true,表示提示风险也委托交易,默认 false

响应

```
{
    "message": "提交失败: [120022][该功能禁止在目前系统状态下运行]\r。",
    "status": 0
}
```

# 买入(异步)

POST /stock/sync/buy 请求体

```
{
   "code": "002188",
   "price": "1.22",
   "volume": 100,
   "acceptRisk": false
}
```

字段	类型	必填	描述	
code	string	是	股票代码,必须是 6位数字的字符串,如: "002188"	
price	float	是	价格,最多支持3位小数,如: 1.22	
volume	int	是	数量,必须是100倍数,如: 1200	
acceptRisk	boolean	否	是否接受风险,如果true,表示提示风险也委托交易,默认 false	

#### 响应

```
{
    "message": "提交成功",
    "status": 0
}
```

# 卖出

POST /stock/sell 请求体

```
{
   "code": "002188",
   "price": "1.22",
   "volume": 100,
   "acceptRisk": false
}
```

字段	类型	必填	描述	
code	string	是	股票代码,必须是 6位数字的字符串,如: "002188"	
price	float	是	价格,最多支持3位小数,如: 1.22	
volume	int	是	数量,必须是100倍数,如: 1200	
acceptRisk	boolean	否	是否接受风险,如果true,表示提示风险也委托交易,默认 false	

```
{
    "message": "提交失败: [120022][该功能禁止在目前系统状态下运行]\r。",
    "status": 0
}
```

### 卖出(异步)

POST /stock/sync/sell 请求体

```
"code": "002188",
    "price": "1.22",
    "volume": 100,
    "acceptRisk": false
}
```

字段	类型	必填	描述	
code	string	是	股票代码,必须是 6位数字的字符串,如: "002188"	
price	float	是	价格,最多支持3位小数,如: 1.22	
volume	int	是	数量,必须是100倍数,如: 1200	
acceptRisk	boolean	否	是否接受风险,如果true,表示提示风险也委托交易,默认 false	

响应

```
{
    "message": "提交成功",
    "status": 0
}
```

# 撤单

POST /stock/cancel 请求体

```
{
  "cancelType": 0
}
```

字段	类型	说明
cancelType	int	0=全部取消 1=取消买入 2=取消卖出

响应

```
{
    "status": 0
}
```

# 撤单(异步)

POST /stock/sync/cancel 请求体

```
{
  "cancelType": 0
}
```

字段	类型	说明
cancelType	int	0=全部取消 1=取消买入 2=取消卖出

响应

```
{
    "message": "提交成功",
    "status": 0
}
```

# 资金信息

GET /stock/assets

```
{
    "data": {
        "资金余额": "434.90",
        "冻结金额": "",
        "可用金额": "432.90",
        "可取金额": "432.90",
        "股票市值": "86359.00",
        "总资产": "86793.90",
```

```
"持仓盈亏": "5526.97",
"当日盈亏": "",
"当日盈亏比": ""
},
"status": 0
}
```

#### 委托

GET /stock/order

响应

```
{
   "data": [
       {
          "交易市场": "深圳A股",
          "合同编号": "13564",
          "备注": ":已成",
          "委托价格": "4.370",
          "委托数量": "1600",
          "委托时间": "13:31:30",
          "成交均价": "4.370",
          "成交数量": "1600",
          "撤消数量": "0",
          "操作": "买入",
          "证券代码": "002494",
          "证券名称": "华斯股份"
      }
   ],
   "status": 0
}
```

#### 持仓

GET /stock/position

#### 成交

GET /stock/trade

#### 请求头

通过以下方法计算出签名,放在请求头 Authorization 中

```
# coding:utf-8
import hashlib
import hmac
import json
import time
import uuid
from urllib.parse import urlparse, parse_qs, urlencode
import requests
from requests.auth import AuthBase
your server addr ="http://localhost:8080/api/v1/stock/"
secretId ="bWYqDxe1ZBiQK4Tt4XCP6vYCWY3QuYxm"
secretKey ="bWYgDxe1ZBiQK4Tt4XCP6vYCWY3QuYxm"
# 认证签名
class SignAuth(AuthBase):
   def __init__(self, secret_id:str = secretKey, secret_key:str = secretKey):
       self.secret_id = secret_id
       self.secret_key = secret_key
   def __call__(self, r):
       # 获取当前时间戳和nonce
       timestamp = str(int(time.time()))
       nonce = str(uuid.uuid4())
       body = r.body or b""
       parsed url = urlparse(r.url)
       query_params = parse_qs(parsed_url.query) # 获取查询参数字典
       # 对查询参数进行排序
       sorted query params = dict(sorted(query params.items()))
       # 将排序后的查询参数重新编码为字符串
       sorted_params_str = urlencode(sorted_query_params, doseq=True)
       # 构造待签名字符串
       sign_data = [
           r.method,
           r.path_url.split("?")[0],
           sorted_params_str,
           timestamp,
           nonce,
```

```
body.decode('utf-8') if isinstance(body, bytes) else body
        1
       sign_data = '\n'.join(sign_data)
       print("签名数据\n",sign_data)
       # 使用HMAC算法和SHA256哈希函数创建签名
       signature = hmac.new(self.secret key.encode('utf-8'), sign data.encode('utf-8'),
hashlib.sha256)
       # 将签名转换为Base64编码的字符串
       signature = signature.digest().hex()
       # 添加必要的认证头
       authorization = f"hmac id=\"{self.secret_id}\", ts=\"{timestamp}\", nonce=\"
{nonce}\", sig=\"{signature}\""
       print("Authorization", authorization)
       r.headers['Authorization'] = authorization
       return r
